

# Data Warehouse Project — Grading Rubric

Instructor: Anthony Ackah-Nyanzu

## 1. Schema Design – 4 pts

Proper star schema with fact and dimension tables, correct relationships between tables.

## 2. ETL / Data Loading – 4 pts

Complete ETL workflow: extract, transform, load. Handles multiple sources and automates loading into warehouse tables.

## 3. Slowly Changing Dimensions – 4 pts

Correct Type 1 (overwrite) and Type 2 (historical) SCD implementations in dimension tables.

## 4. Data Quality & Integrity – 3 pts

Ensure no duplicates, proper null handling, and referential integrity between fact and dimension tables.

## 5. Querying & Reporting – 3 pts

Can generate meaningful reports and metrics from the warehouse using SQL queries or visualization tools.

## 6. Documentation & Presentation – 2 pts

README with ETL process, schema diagrams, example queries, and optionally a short presentation of workflow and results.

| Category                     | Points |
|------------------------------|--------|
| Schema Design                | 4      |
| ETL / Data Loading           | 4      |
| Slowly Changing Dimensions   | 4      |
| Data Quality & Integrity     | 3      |
| Querying & Reporting         | 3      |
| Documentation & Presentation | 2      |
| Total                        | 20     |

### Key Reminders for Students:

- Use surrogate keys for Type 2 dimensions to track historical changes.
- Keep ETL workflows modular and document the process.
- Validate data quality: no duplicates, proper null handling, referential integrity.
- Implement meaningful queries or reports using the warehouse.
- Optional: use visualization tools like Power BI, Tableau, or dashboards for reporting.
